

Flexbrick® in the renovation of Parking Saint Roch, an impressive building in Montpellier

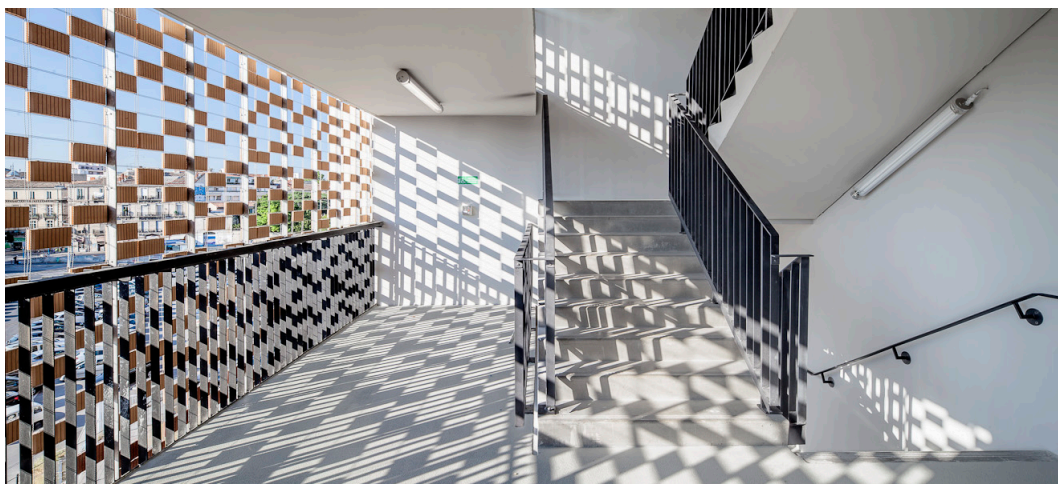

Architectural concepts have evolved in the last years and singularity is the key to successful projects that leave a mark. Flexbrick®; a tailored constructive system based on a flexible steel mesh in which a wide range of materials can be inserted to wrap architectural spaces, is positioned as the best partner to guarantee uniqueness and exclusive design to a wide range of projects.

One of the best examples of Flexbrick's® advantages is the renovation of Parking Saint Roch in Montpellier. A renovation project by Archikubik that emphasizes the transformation of an unsightly building into a singular, elegant and expressive edification. Located in the centre of Montpellier, in the heart of the railway landscape, this new parking concept catches the eye for the brightness that Flexbrick's® constructive system brings into it. A new architectural paradigm without limits which offers both exclusive design and sustainability.

Parking Saint Roch embeds in its DNA code the potential mutability to accommodate future uses like offices and homes, as well as other emerging uses in this new era of information society integrating time vector to aim for ageless architecture. Moreover, the use of a sustainable material like clay, combined with an innovative application, Flexbrick' ceramic system, brings the building to a kinder scale, making it turn into an organoleptic building that vibrates to the passing of trains and wind.

In a nutshell, Flexbrick's® system can be inserted to wrap architectural spaces and tailor the best projects possible, expressing uniqueness and enhancing architectural projects through pattern, format and materials.
